

Why upgrade to Zetafax 2010?

Introducing a range of new features, Zetafax 2010 is the latest release of Equisys' award winning network fax software. It continues to be one of the world's leading fax server products, installed in over 60,000 customer locations in over 100 countries.

Zetafax 2010 provides existing customers with the tools to make their business more efficient by integrating with the latest technologies.

“Standard Edition” FoIP Connector

Zetafax 2010 supports a new version of the Zetafax Fax over IP (FoIP) Connector, which runs within the Zetafax Server program set as an alternative to using Brooktrout SR140 technology. This now provides the following options for the FoIP Connector:

- SR140 Edition - using the Brooktrout SR140 product for the highest levels of performance and interoperability.
- Standard Edition - using Equisys FoIP software, providing a more cost-effective solution for companies wishing to use FoIP with specific T.38 gateway units. For more information on supported gateways, please contact Equisys or your software provider.

Support for Microsoft Office 2010

Zetafax 2010 adds support for Office 2010, with the following features available:

Microsoft Word and Excel:

- Send fax - providing a visible method of sending a fax, particularly for users who are not aware of the Zetafax Printer and print-to-fax behavior.
- Add embedded commands - simplifying the process of automating fax settings or recipient details when sending a fax

Microsoft Outlook:

- Send fax - providing a clear helper form to ease sending a fax without having to use a specialized syntax on the standard ‘compose email’ form.
- View fax - providing a specialized form designed for viewing faxes, loaded automatically when viewing faxes received using the Zetafax email gateway.
- Preview and release fax - enabling the user to check how a fax will appear before sending, without having to revert to the Zetafax Client.
- Set default options for sent faxes - providing a simple method for users to customize behavior without requiring administrator intervention.

The Zetafax 2010 release includes the following:

- “Standard Edition” FoIP Connector
- Support for Microsoft Office 2010
- Support for Exchange 2010
- Added support for server virtualization
- Improved performance with FaxBroadcast
- Other quality and performance improvements

Support for Exchange 2010

Zetafax 2010 also adds support for Exchange 2010, installing as a native connector within Exchange that is registered to handle the FAX address type. Unlike products which use SMTP to integrate with Exchange, this native integration means users can send faxes to contacts stored within Outlook using the standard fax number fields, rather than having to create additional contacts to place the fax number in the email field.

Added support for server virtualization

Zetafax 2010 also adds support for the latest release of VMware ESX and ESXi (version 4.0) and the VMware vSphere suite, and also introduces support for Microsoft Hyper-V with Windows Server 2008 R2. This provides a range of options for businesses planning virtualized server environments, enabling the Zetafax server in the same environments to provide protection against computer hardware failure. The Zetafax server can be moved onto another physical computer quickly and easily, avoiding the need for a separate failover server just for fax.

Improved performance with FaxBroadcast

Significant performance improvements have been made to FaxBroadcast, including load testing with batches of over 100,000 faxes and 200 fax lines. Initial batch load, submission and reporting times have been reduced to improve usability, and system throughput has also been improved.

Other quality and performance improvements

As with all new versions of Zetafax, Zetafax 2010 includes a number of other quality and performance improvements to address issues that have been reported by our customer base, or identified during our ongoing quality assurance testing.

Next steps
